Comments /notes on tonight's mission and this interpretation: Reported growth and noted change is based growth since last IR flight on 8/3. The fire has advanced nearly 0.5 miles to the west of the previous IR flight's perimeter, in the upper Roaring Creek drainage. The fire's edge has advanced one mile to the south from the previous IR perimeter, though it remains 0.5 miles from McGuire Lake. No intense heat was detected tonight. The western flank shows large pockets of scattered heat as does the southern portion of the fire. Isolated heat sources were detected throughout the fire area.
